

Multiple Overimputation: A Unified Approach to Measurement Error and Missing Data

Matthew Blackwell James Honaker Gary King

July 24th, 2010

We want to convince you of three things

We want to convince you of three things

1. Measurement error is deeply problematic for political science research and current approaches are incorrect or unused.

We want to convince you of three things

1. Measurement error is deeply problematic for political science research and current approaches are incorrect or unused.
2. Missing data is the limiting, most extreme form of measurement error.

We want to convince you of three things

1. Measurement error is deeply problematic for political science research and current approaches are incorrect or unused.
2. Missing data is the limiting, most extreme form of measurement error.
3. We can rework the multiple imputation framework to simultaneously correct for both missing data and measurement error.

PART ONE:

How we deal with measurement error.

- inapplicable with multiple variables.
- invalid with heteroskedastic errors.

Most existing approaches are

- application-specific.
- model dependent.
- difficult to implement.
- inapplicable with multiple variables.
- invalid with heteroskedastic errors.
- unusable with missing data.

Why is this the state of the art?

Why is this the state of the art?
It's easy and tolerated.

Why is this the state of the art?
It's easy and tolerated.
But it's make believe.

EMBRACE YOUR BAD DATA

EMBRACE YOUR BAD DATA

FIX IT.

PART TWO:

A Brief Review of Measurement Error.

observed

$$x_i = x_i^* + u_i$$

observed

latent

$$x_i = x_i^* + u_i$$

observed

latent

measurement
error

$$x_i = x_i^* + u_i$$

observed latent measurement
error

The diagram illustrates the components of a measurement model equation. Three labels are positioned above the equation: 'observed' above x_i , 'latent' above x_i^* , and 'measurement error' above u_i . Arrows point from each label to its corresponding variable in the equation.

$$x_i = x_i^* + u_i$$

$$u_i | x_i^* \sim \mathcal{N}(0, \sigma_u^2)$$

observed latent measurement
error

The diagram shows three labels at the top: 'observed', 'latent', and 'measurement error'. Arrows point from each label to a corresponding term in the equation $x_i = x_i^* + u_i$ below. 'observed' points to x_i , 'latent' points to x_i^* , and 'measurement error' points to u_i .

$$x_i = x_i^* + u_i$$

$$u_i | x_i^* \sim \mathcal{N}(0, \sigma_u^2)$$

unbiased
independent

The words 'unbiased' and 'independent' are stacked vertically. Two red arrows originate from the space between these words and point upwards towards the 0 in the normal distribution notation of the equation above.

observed latent measurement
error

The diagram shows three labels at the top: 'observed', 'latent', and 'measurement error'. Arrows point from each label to a corresponding term in the equation $x_i = x_i^* + u_i$. The 'observed' label points to x_i , the 'latent' label points to x_i^* , and the 'measurement error' label points to u_i .

$$x_i = x_i^* + u_i$$

$$u_i | x_i^* \sim \mathcal{N}(0, \sigma_u^2)$$

unbiased
independent

The diagram shows the text 'unbiased independent' at the bottom. Two arrows point from this text to the terms x_i^* and σ_u^2 in the equation above. The arrow pointing to x_i^* is black, and the arrow pointing to σ_u^2 is red.

measurement
error
variance

The diagram shows the text 'measurement error variance' in red at the bottom right. A red arrow points from this text to the term σ_u^2 in the equation above.

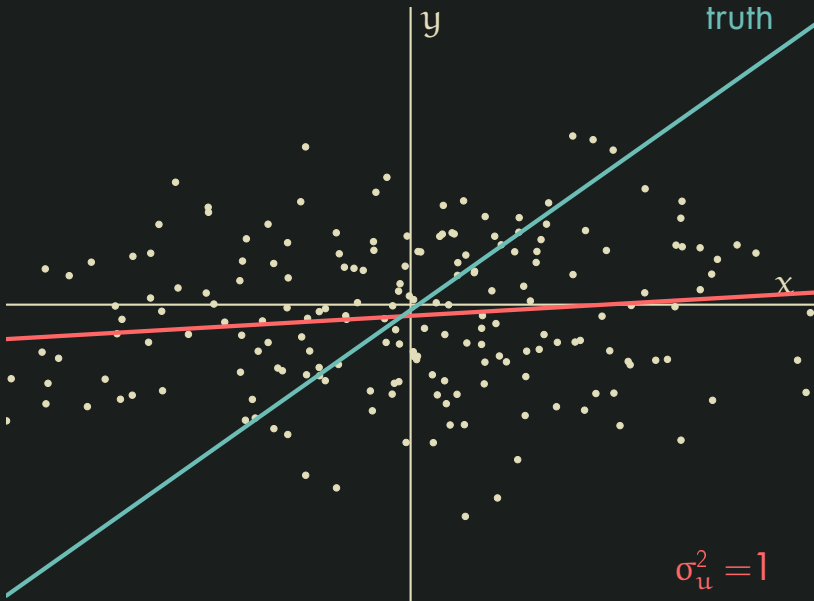

ATTENUATION

...only guaranteed in the simplest of cases:

ATTENUATION

...only guaranteed in the simplest of cases:

linear model

ATTENUATION

...only guaranteed in the simplest of cases:

linear model
one mismeasured variable

ATTENUATION

...only guaranteed in the simplest of cases:

linear model

one mismeasured variable

measurement error unrelated to other variables and x^* .

BIAS FROM MEASUREMENT ERROR

In unpredictable directions with most realistic models.

PART THREE:

The connection between missing data and measurement error.

The strict dichotomy of data.

observed

missing

(fully) observed

(fully) missing

(fully) observed

(fully) missing

The false dichotomy of data.

fully
observed

fully
observed

fully
missing

fully
observed

partially
missing

fully
missing

But what is this continuum?

observed latent measurement
error

$x_i = x_i^* + u_i$

The diagram illustrates the measurement model equation $x_i = x_i^* + u_i$. Three labels are positioned above the equation: 'observed' above x_i , 'latent' above x_i^* , and 'measurement error' above u_i . Arrows point from each label to its corresponding variable in the equation.

$$u_i | x_i^* \sim \mathcal{N}(0, \sigma_u^2)$$

measurement
error
variance

A red arrow points from the text 'measurement error variance' to the σ_u^2 term in the equation $u_i | x_i^* \sim \mathcal{N}(0, \sigma_u^2)$ above.

fully
observed

partially
missing

fully
missing

fully
observed

partially
missing

fully
missing

$$\sigma_u^2 = 0$$

observed latent measurement
error

The diagram illustrates the components of a measurement model equation. Three labels are positioned above the equation: 'observed' above x_i , 'latent' above x_i^* , and 'measurement error' above u_i . Arrows point from each label to its corresponding term in the equation.

$$x_i = x_i^* + u_i$$

$$u_i \sim \mathcal{N}(0, 0)$$

measurement
error
variance

A teal arrow points from the text 'measurement error variance' to the second zero in the normal distribution notation $\mathcal{N}(0, 0)$ of the equation above.

observed latent measurement
error

$x_i = x_i^* + u_i$

The diagram illustrates the measurement model equation $x_i = x_i^* + u_i$. Three labels are positioned above the equation: 'observed' above x_i , 'latent' above x_i^* , and 'measurement error' above u_i . Arrows point from each label to its corresponding term in the equation.

$$u_i \sim \mathcal{N}(0, \sigma^2)$$

measurement
error
variance

The diagram shows the error distribution $u_i \sim \mathcal{N}(0, \sigma^2)$. A label 'measurement error variance' is positioned below the equation, with an arrow pointing from the variance parameter σ^2 to the label.

fully
observed

partially
missing

fully
missing

$$\sigma_u^2 = 0$$

Missing data is the most
extreme case of measurement error.
